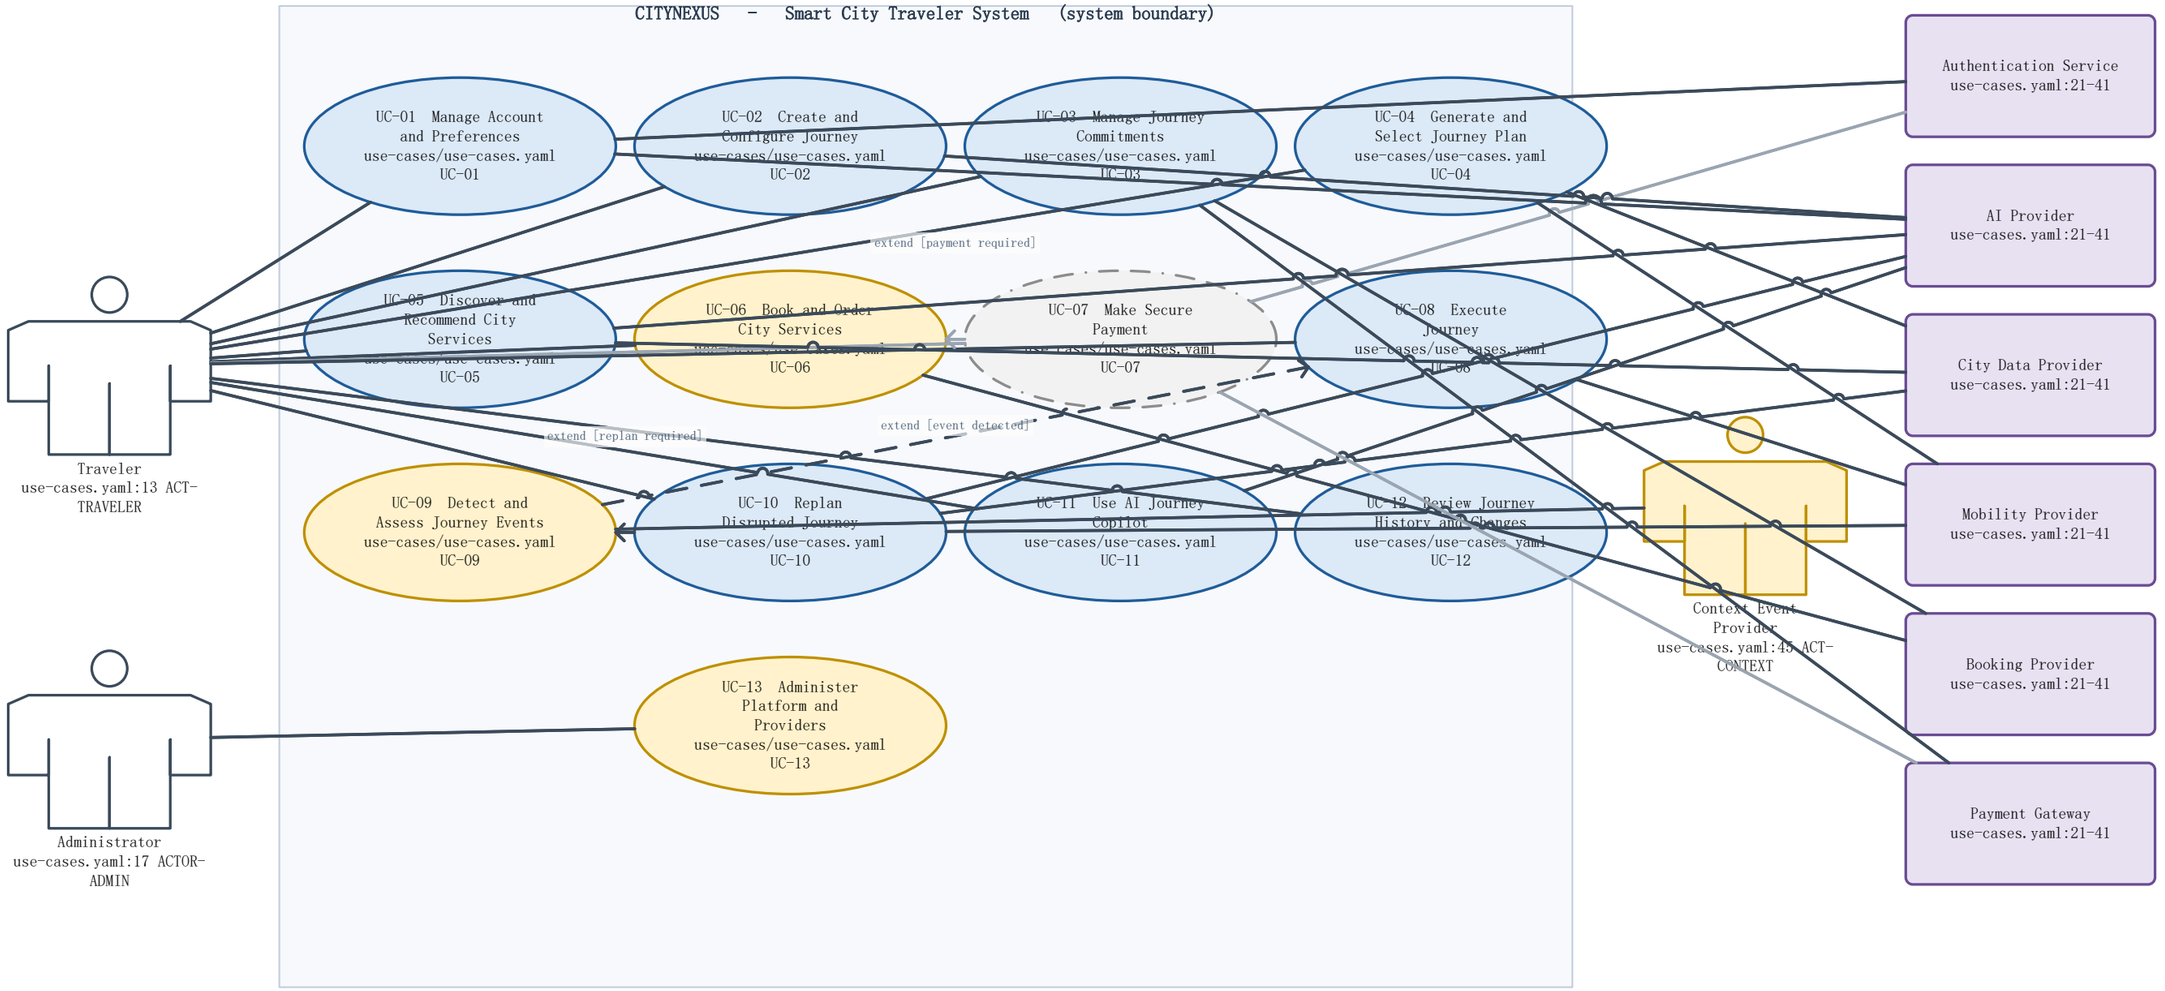
CityNexus | UML Use Case Model



Legend

- Implemented + evidence
- Implemented, not proven on the line
- Specified, no real implementation
- Human actor
- <<external system>>

Source: use-cases/use-cases.yaml v0.1.0, status baseline-candidate. 13 top-level use cases, 9 actors, 17 relationships (14 include, 3 extend). Every arrow on this page is one of those relationships or a primary/supporting actor link listed against a use case.

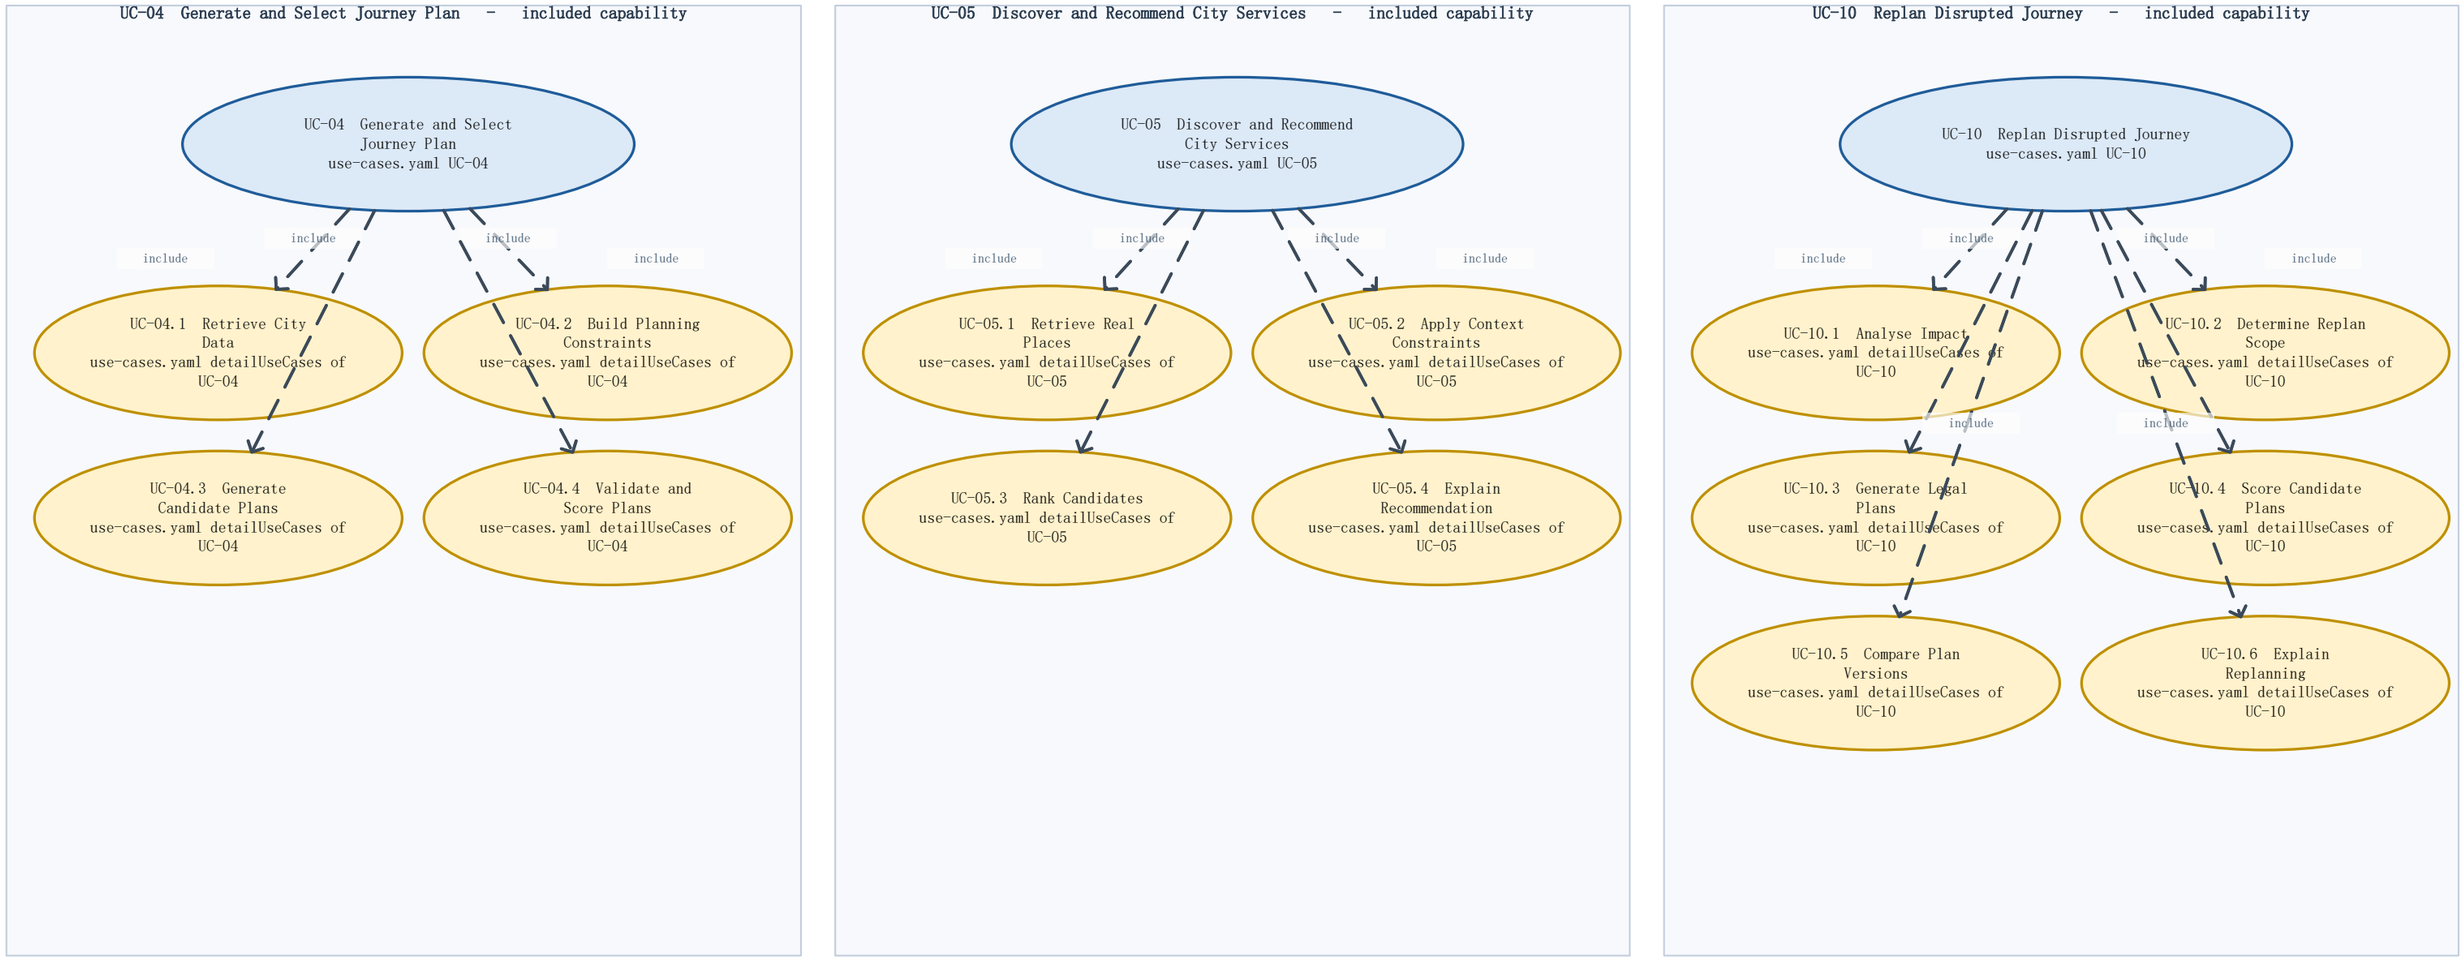
UC-07 Make Secure Payment is dashed because no real payment instrument is registered: the code ships mock-payment only and AGENT_TOOL_CATALOG.md:16-18 says capture and refund are not registered.

The internal planning solver is deliberately not an actor (use-cases.yaml modelNotes), and the AI provider may suggest or explain but never owns feasibility or persistence authority.

All requirements are still status proposed: the customer agreement the coursework asks for is separate, so this is a baseline candidate, not approved scope.

CityNexus | UML Use Case Model

Page 2 of 2 - the fourteen «include» relationships from use-cases.yaml, grouped under the three use cases whose decomposition is part of the Part 2 documentation scope.
Keeping them off page 1 is what makes page 1 readable.



Legend

Parent use case, implemented

Included sub-use case

These fourteen are documentation-scope detail, not extra business scope: use-cases.yaml modelNotes says UC-04.x, UC-05.x and UC-10.x are focused Part 2 detail use cases used for UML detail.
Each arrow is one of the 14 include entries in the relationships block of the same file, so the count on this page is checkable against the YAML.
